IDENTIFICATION MARKS FOR

HEX NUTS & HEAVY HEX NUTS

STANDARD	MARKINGS			DESCRIPTION
	GRADE 2	GRADE 5	GRADE 8	
IFI Fastener Standards, 6th Ed.	Nuts milled from bar stock: 		 Nuts milled from bar stock: 	SAE Grade 2 nuts need not be marked. SAE Grade 5 and 8 nuts are required to be grade identified, using the "clock" marking system. A dot is located at one corner on the top surface to indicate 12 o'clock, and a radial line is placed at the 5 and 8 o'clock position to identify Grades 5 and 8 respectively. Nuts which are milled from the bar on screw machines are normally grade identified with small notches cut into the corners of the hex, one for Grade 2, two for Grade 8.
SAE J995	No Marking Required	 or 	 or 	Grade 2 nuts are not required to be marked for grade identification. Grade 5 nuts shall be marked for grade identification with a dot and a radial or circumferential line at 120° counterclockwise from the dot. Grade 8 nuts shall be marked for grade identification with a dot and a radial or circumferential line at 60° counterclockwise from the dot. Nuts fabricated by cutting from hex bar stock shall be grade marked with notches at the hexagon corners, one notch at each corner for Grade 5, two notches at each corner for Grade 8.
ASTM A563	No Marking Required for Grades O, A, and B	Grades C, C3 	Grades D, DH, DH3 	Grades O, A, and B are not required to be marked unless specified. When specified, the mark shall be the grade letter symbol on one face of the nut. Grade C nuts shall be marked on one face with three circumferential marks 120° apart. Grade C3 nuts shall be marked on one face with three circumferential marks 120° apart and the numeral 3. Grades D, DH, and DH3 shall be marked with the grade letter symbol on one face.
MIL-S-1222H	No Marking Required			Grade 2 nuts are not required to be marked for grade identification. Grade 5 nuts shall be marked with three circumferential dashes equally spaced 120° apart. Grade 8 nuts shall be marked with six circumferential dashes equally spaced 60° apart.
ISO 898/2	Class 8 	Class 9 	Class 10 	Nuts of thread diameters greater than or equal to 5mm and property class equal to or higher than class 8 shall be marked on one surface with the class identification number. Alternately these may be marked with the "clock-face" system which consists of a dot at one corner to indicate 12 o'clock and a radial line placed at the appropriate clock position. Nuts marked with one notch at the hexagon corners as shown below indicates a left-hand thread.

Surface condition of the assembly mating parts may have a significant effect on establishing the correct torque-tension relationship. Please refer to the American Institute of Steel Construction (AISC) publication "Specification for Structural Joints Using ASTM A325 or A490 Bolts" for assembly technique.

TIGHTENING TORQUES

FOR METRIC BOLTS, SCREWS, AND NUTS

REF: MANUFACTURER'S CATALOG

FAILURE OF THREADED FASTENERS DUE TO OVER - TIGHTENING CAN OCCUR BY BOLT SHANK FRACTURE OR BY STRIPPING OF THE NUT AND / OR BOLT'S THREAD. A BOLT OR SCREW ASSEMBLED WITH A NUT OF THE APPROPRIATE CLASS IS INTENDED TO PROVIDE AN ASSEMBLY CAPABLE OF BEING TIGHTENED TO THE BOLT PROOF LOAD WITHOUT THREAD STRIPPING OCCURING.

THE TORQUE VALUE TO BE SET FOR A PATICULAR SIZE OF SCREW IS DEPENDENT UPON:

1) MATERIAL OF THE SCREW
2) PARENT MATERIAL (STEEL, NON - FERROUS METAL OR PLASTIC)
3) WHETHER THE SCREW IS UNTREATED OR PLATED
4) WHETHER THE SCREW IS DRY OR LUBRICATED
5) THE DEPTH OF THE THREAD

TABLES BELOW ARE GIVEN FOR INFORMATIONAL USE ONLY. THE EXACT TORQUE VALUES ARE FOUND BY TESTS BASED UPON WORK EXPERIENCE

*NYLON FIGURES ONLY ARE BREAKING TORQUE: RATHER THAN SAFE WORKING TORQUE.

WHAT IS TORQUE

TORQUE IS A TWISTING FORCE. TORQUE IS APPLIED TO YOUR WATCH STEM WHEN YOU WIND YOUR WATCH. YOU APPLY TORQUE TO UNSCREW THE TOP OF A MASON JAR. TORQUE CAUSES ROTATION OF A SHAFT, OR IT WILL SET UP A TWIST IN A STATIONARY SHAFT. IT IS GENERALLY EXPRESSED IN FOOT POUNDS OR IN INCH POUNDS.

HOW IS TORQUE DETERMINED?

A WRENCH ON A SHAFT--OR A STRING WRAPPED AROUND A WHEEL OR PULLEY--WILL GIVE AN ACCURATE TORQUE READING. USE A SCALE TO DETERMINE THE POUNDS OF PULL AND A RULE TO MEASURE THE RADIUS. COMPUTE THE INCH OR FOOT POUNDS OR FORCE BY USING THE FORMULA.

THE FORMULA FOR TORQUE IS: T = RXS
WHERE R = RADIUS OR LENGTH OF LEVER
S = POUNDS PULL ON SCALE

IF A SHAFT CONNECTED TO A 2 FT. LEVER OR ARM REQUIRES 2 LBS. OF FORCE TO CAUSE IT TO RATE. THE TORQUE WOULD BE 4 FT. LBS.

PROPERLY FASTENED THREADED PRODUCTS ACHIEVE THEIR HOLDING POWER FROM THE TORSION (OR TORQUE) THAT IS DERIVED FORM THE MATING OF THE EXTERNAL AND INTERNAL THREADS SUBJECT TO THE ELASTIC LIMIT OF THE MATERIAL.

WHAT TORQUE TO APPLY IS A GENERALLY ASKED QUESTION, BUT THE ANSWER DEPENDS ON THE VARIABLES OF MATERIAL, THREADS' CLASS OF FIT, METHOD OF THREAD MANUFACTURE, AND THREAD LUBRICATION--IF ANY.

THE TABLE ON THE LEFT IS OFFERED AS THE SUGGESTED MAXIMUM TORQUING VALUES FOR THREADED PRODUCTS MADE FROM CORROSION-RESISTANT METALS.

ALL VALUES SHOWN ON CHART EXCEPT FOR NYLON REPRESENT A SAFE WORKING TORQUE: IN THE CASE OF NYLON ONLY, THE FIGURES REPRESENT BREAKING TORQUE.

GALVANIC CORROSION

(ELECTROCHEMICAL)

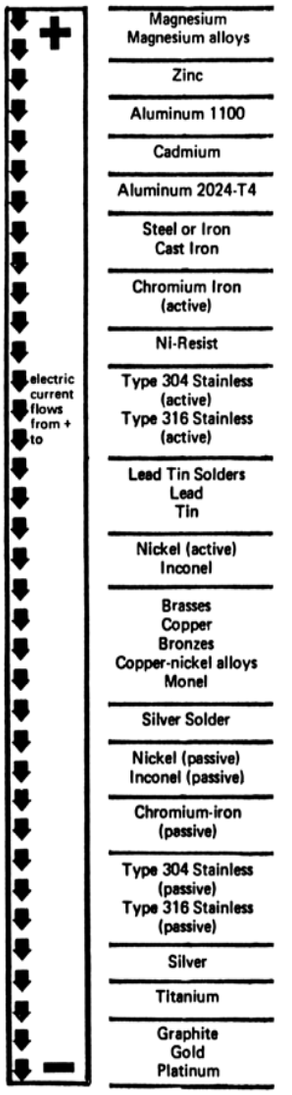

GALVANIC ATTACK

1 IF POSSIBLE, USE THE SAME OR SIMILAR METALS IN AN ASSEMBLY, ESPECIALLY WHERE AN ELECTROLYTE MAY BE PRESENT.

2 WHEN DISSIMILAR METALS ARE USED TOGETHER IN THE PRESENCE OF AN ELECTROLYTE, SEPARATE THEM WITH A DIALECTRIC MATERIAL SUCH AS INSULATION, PAINT OR COATING.

GALVANIC SERIES CHART

THIS REPRESENTATIVE SAMPLE OF DISSIMILAR METALS INDICATES RELATIVE POTENTIAL FOR GALVANIC CORROSION. COUPLING METALS WIDELY SEPARATED ON THE CHART IS MOST LIKELY TO CAUSE CORROSION.

STAINLESS STEELS CHARACTERISTICS

THE FAMILY OF STAINLESS STEELS IS DIVIDED INTO THREE GENERAL CLASSIFICATIONS.
"AUSTENITIC" STAINLESS STEELS MAKE UP THE GENERAL GROUP OF THE 18-8 (OR 300) SERIES. THEY ARE THE CHROMIUM-NICKEL TYPE CONTAINING UPWARDS OF 8% NICKEL. THEY ARE NOT HARDENABLE BY HEAT TREATMENT, NON-MAGNETIC FOR PRACTICAL PURPOSES AND OFFER THE GREATEST DEGREE OF CORROSION RESISTANCE.
"MARTENSITIC" STAINLESS STEELS CONTAIN FROM 12 TO 20% CHROMIUM. THEY ARE MAGNETIC AND HARDENABLE. TYPE 410 AND 416, COMMON FASTENING ALLOYS, ARE MARTENSITIC STAINLESS STEELS.
" FERRITIC" ALLOYS ARE ALSO CHROMIUM STAINLESS STEEL ALLOYS. THEY ARE MAGNETIC AND NOT HARDENABLE BY HEAT TREATMENT. TYPE 430 IS AN EXAMPLE.

TYPE 304: AN 18-8 GRADE GENERALLY USED FOR COLD HEADED PRODUCTS. IT IS SOMEWHAT SUPERIOR TO TYPE 302 IN CORROSION RESISTANCE AND FOR THAT REASON IS NOW THE ALLOY USED BY HARPER FOR MANY STANDARD HEADED FASTENERS.

TYPE 309: A CHROMIUM-NICKEL GRADE WITH APPROXIMATE RATIO OF 12% NICKEL AND 22% CHROME. THE ADDITIONAL AMOUNT OF NICKEL AND CHROME MAKE IT DESIRABLE ON HIGH TEMPERATURE APPLICATIONS. IT IS DIFFICULT TO MACHINE BUT CAN BE USED FOR SOME COLD HEADED PRODUCTS.

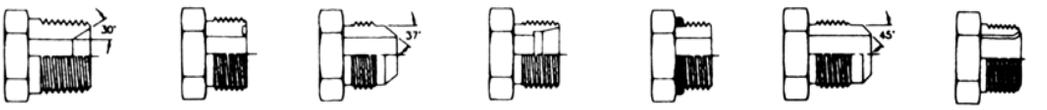

TYPE 316: SOMETIMES REFERRED TO AS SMO STAINLESS STEEL. IT DIFFERS FROM 304 MAINLY BY ITS MOLYBDENUM CONTENT AND HAS QUALITIES WHICH GIVE IT SUPERIOR CORROSION RESISTANCE TO OTHER CHROMIUM NICKEL STEELS WHEN EXPOSED TO SEA WATER AND MANY TYPES OF CHEMICAL ATMOSPHERES. IT IS ALSO A SUPERIOR STAINLESS STEEL FOR STRENGTH AT HIGH TEMPERTURES. MANY OF OUR STOCK ITEMS ARE MADE FROM TYPE 316 STAINLESS STEEL.

TYPE 410: A STRAIGHT CHROMIUM ALLOY CONTAINING NO NICKEL. IT IS A GENERAL PURPOSE CORROSION AND HEAT RESISTING, HARDENABLE CHROMIUM STEEL. IT CAN BE EASILY HEADED AND HAS FAIR MACHINING PROPERTIES.

NOTE: Nominal pipe sizes do not agree with either the I.D., O.D., or thread sizes. To determine pipe size (up to 1-1/4") measure the diameter of the threads and subtract 1/4" For example, subtract 1/4" from a 1" pipe to obtain the nominal pipe size of 3/4".

WORKING PRESSURES - HOSE (cont.)

Pressure

Working Pressure Chart

PARKER HOSE SIZE / RECOMMENDED MAXIMUM WORKING PRESSURES
In addition to pressure, other factors must also be considered in the selection of the proper hose, e.g. fluid compatability, temperatures, environment, etc. For additional information on a specific hose,consult the respective hose listing in this catalog.

FASTENER PLATING AND FINISHES

Finish	Color	For Use On (Material)	Corrosion Resistance	Characteristics
Zinc (electroplated)	White to blue grey	All metals	Good	Most common used plating. Good rust-resisting qualities, appearance and low cost.
Cadmium (electroplated)	Bright or dull silver grey	All metals	Excellent	Superior rust-resisting qualities used in marine and aviation applications. Relatively high cost and toxic to the environment.
Chromate	Yellow, olive drab, black, blue/white	Zinc & cadmium plated parts	Very good	A secondary dipping process after plating increasing corrosion resistance, adding color or brilliance.
Black Oxide	Black	Ferrous metals and stainless steel	Fair	A chemical discoloration which does not add to part thickness. Usually combined with an oil dip. Rust resistance comes from the oil only.
Phosphate & Oil	Charcoal grey or black	Steel	Good	Zinc or manganese phosphate used with a rust-inhibiting oil dip. Low cost.
Color Phosphate	Blue, green, red, purple, etc.	Steel	Very Good	Chemically produced coating superior to regular phosphate and oil.
Iridite	Olive drab, green, black, red, blue, bronze	All metals	Good	Applied on top of zinc or cadmium plating as a die for color and additional corrosion protection.
Nickel	Silver	All metals	Very good	Hard stable finish, relatively expensive and sometimes hard to apply.
Chromium	Bright blue/white	All metals	Very good	Hard lustrous finish adds wear resistance and is very expensive.
Hot Dip Zinc (galvanizing)	Dull grey	All metals	Very Good	Parts are dipped in pure zinc. Gives maximum corrosion protection. Adds a thick irregular coating. Size must be adjusted to allow for thickness of coat.
Passivating	Bright - etched	Stainless steel	Excellent	Parts are dipped in nitric acid which removes iron particles and brightens the finish. Produces a passive corrosion-resistant finish.
Anodizing	Frosty - etched	Aluminum	Excellent	Acid dip produces a hard oxide surface. Can be color dipped after anodizing for preferred finish.

GLOSSARY OF TERMS

Fastener Steels:

Alloy Steels Steels alloyed with molybdenum, nickel and chromium (AISI 4037, 4130, 630) are best where high strength is required.These steels have good cold-forming properties in the annealed condition. Can be heat treated for the best combination of strength, toughness and shock resistance.

Aluminum Alloys Good cold-forming characteristics. Many aluminums can be used (2024, 3003, MM, MM, 6061, 7075), and where secondary machining is required (2011). Aluminum is corrosion resistant and some can be heat treated.

Carbon Steels. Fine grain, fully-killed basic steel with no alloying agent.

Low carbon steel range from .06-.1 8% carbon content (AS 1006-1018) and have good ductility for cold forming.

Medium carbon steel have .1 8-.50% carbon content (AISI 1018, 1038, 1041). /stronger and less ductile, these steels respond well to quench and temper.

High carbon steels .50% carbon and up (AISI 1066,1095). Difficult to cold form unless annealed. High strength, can be heat treated.

Hard drawn MB Spring Wire, ASTM A227 Carbon range .60-.70%. Used for general purpose low-cost spring. Commonly available in diameters .031 to .500. Lower tensile strength than music wire. Leaded Steels. Lead added to steel improves machinability. Identified by an "L", (AISI 12 14) in the AISI/SAE designation, his is most commonly added to 1100 and 1200 series 'screw machine' steels. Leaded steels are not suitable for the treatment of welding.

Music Wire, ASTM A228 Carbon range .80-.95%. High tensile strength can withstand repeated loading. Widely used in small diameter rounds .005 to .125

Resulphurized and Rephosphorized Steels (AISI 117 and 1215) have improved machinability over basic carbon steels. Used commonly for screw machine parts, they are more brittle, less ductile and stronger than equivalent carbon content basic steel. Sulphur acts as an internal lubricant and is the major alloying agent for "1000" series steels. Phosphorous makes the steel more brittle, reducing friction, heat and tool wear. " 1200" series steels have both phosphorous and sulphur as alloys.

Stainless Steels (AISI202, 302, 304, 316) are generally nonmagnetic and the best corrosion resistant due to their large content of nickel and chromium. Good cold-forming characteristics are subject to work hardening and are not heat treatable.

Austenitic stainless steel is a straight chromium steel with little or no nickel (AISA 410, 420). These steels are magnetic and can be heat treated. Higher than austenitic types, lower corrosion resistance and harder to cold form.

Precipitation Hardening Stainless (AISI 17-4PH) is a nickel chromium stainless with cobalt and tantalum. The alloying agents produce high strength and ductility, good machinability and weldability. Hardening is by aging the cold steel at 900˚ F for 4 hours followed by air cooling. Not used for cold forming but commonly used for high strength, corrosion resistant screw machine parts.

Mechanical Definitions

Cold working Deformation of a metal at room temperature without fracture which changes its shape and produces higher tensile strength and machinability.

Ductility The ability of the metal to be deformed extensively under tension load without rupture or fracture. Ductility is expressed in terms of percent elongation and percent reduction of area (e.g. drawn into wire).

Machinability The condition of property of a metal which allows it to be cut, turned, broached or formed by machine tools.

Malleability The ability of a metal to be deformed permanently under compression load without rupture or fracture (e.g. hammer or rolled into sheets.

Tensile Strength The maximum load in tension (pulling apart or shearing) which a material can withstand before breaking or fracturing. Also known as the ultimate tensile strength (UTS) or maximum strength.

Work Hardening Hardening that takes place through grain alignment when a metal is bent, rolled or hammered at room temperature, Not all metals work harden.

Yield Strength The maximum load at which a material exhibits a specific permanent deformation. Deformation to determine yield varies with material.

Process Definitions:

Alloy Steel A carbon steel to which one or more elements are added to add special properties for a specific use.

Billet A cast section of steel 4 to 6 inches square about 20 ft. long from which dimensional shapes of steel are rolled.

Brass An alloy of copper and zinc which can contain small amounts of aluminum, iron, manganese, or tin to produce specific properties.

Bronze An alloy of copper and tin or an alloy of aluminum and silicon.

Carbon Steel A Steel in which carbon is the only alloying element added to iron.

Killed Steels Molten steel treated with aluminum, silicon, or manganese until no more gas is in the metal and it is in a quiet state.

Pickling The removal of oxide scale from metal by dipping it in a diluted acid bath. The chemically clean surface is then ready for cold rolling or wire drawing.

Rockwell Hardness Test A method of determining metal hardness by indenting with a metal ball or diamond cone under a specified load.

Heat Treating Definitions

Annealing heating and slow cooling to remove stresses,make steel softer,refine the structure, or change its ductility.

Carburizing Adding carbon to the surface of iron-based alloys by heating the metal below its melting point in contact with carbon-rich solids, liquids or gasses.

Case Hardening Carburizing a metal surface followed by quenching to fix a hard outer case in carbon combined with a relatively soft middle or core.

Cyanide Hardening A method of case hardening which brings the metal surface in contact with the molten cyanide salt followed by a quenching.

Decarburization removal of carbon from the surface of steel. This can occur through normal oxidizing action or as the result of heat treatment.

Drawing (Tempering) Reheating after hardening, held at a specific temperature and then quenched, This reduces hardening and increases toughness.

Hydrogen Embrittlement A condition where the surface finishing of metal (plating) results in a brittle outer case due to immersion in acid. Baking immediately following the plating process removes his brittle surface condition.

Nitriding A hardening process which adds nitrogen to a metal surface through contact with ammonia gas. Produces surface hardness (case) without quenching.

Precipitation Hardening A hardening process where certain metals are held at elevated temperature without quenching (age hardening).

Quenching Rapid cooling of steel by immersion in oil or water to fix its structure in a hardened state.

Sphereoidizing (anneal) Any process of heating and cooling steel the produces a rounded or globular form of carbide. This softens the metal, improving ductility.

Stress Relieve A low temperature heat treatment which removes stresses caused by cold working.

Clevis Pin Definitions:

Length Refers to length under head to end of pin.

Effective Length Length under head to the edge of the hole closest to the head. Also known as grip length.

Overall Length Total length of the pin form the top of the head to the opposite end.

The approved NORTH AMERICAN STYLE, METRIC, SLOTTED and PHILLIPS PAN HEAD MACHINE SCREW fully meets the specifications of IFI 513, 1982. The head dimensions and contours differ from the European Style DIN 85, and instead, conform to the traditional style which is preferred by Canadian customers. The Metric coarse thread is interchangeable with all other coarse-threaded Metric fasteners as listed in this catalog.

BLIND RIVETS

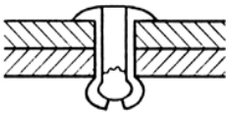

DIMENSIONAL & APPLICATION DATA

1. The shear and tensile strength of the rivet selected and the number of rivets used in the application should equal or exceed the joint strength requirements. Typical ultimate shear and tensile values of Blind rivets should be considered in all riveting applications.

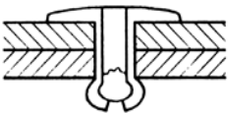

2. Determine the total material thickness to be joined. Refer to the GRIP RANGE column on the specification page; select the rivet that equals or exceeds the application thickness. Note the rivet barrel length, Column L, is not the grip range.

3. The rivet body alloy, in addition to being chosen for strength requirements, should also be selected for compatibility with the materials to be joined to avoid galvanic corrosion caused by coupling dissimilar metals. If dissimilar metals are widely separated on the galvanic chart, it is advisable to separate them with a dielectric material such as paint or other coating.

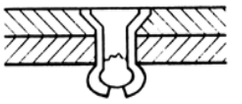

4. HEAD STYLES

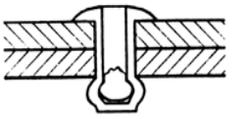

BUTTONHEAD
BLIND RIVETS are the most popular for industrial applications. The low profile head diameter is twice the rivet body diameter, providing adequate bearing surface for nearly all applications.

LARGE FLANGE
BLIND RIVETS provide greater bearing surface for bearing surface for fastening soft and brittle facing materials such as plywood and plastics including neoprene, vinyl, etc.

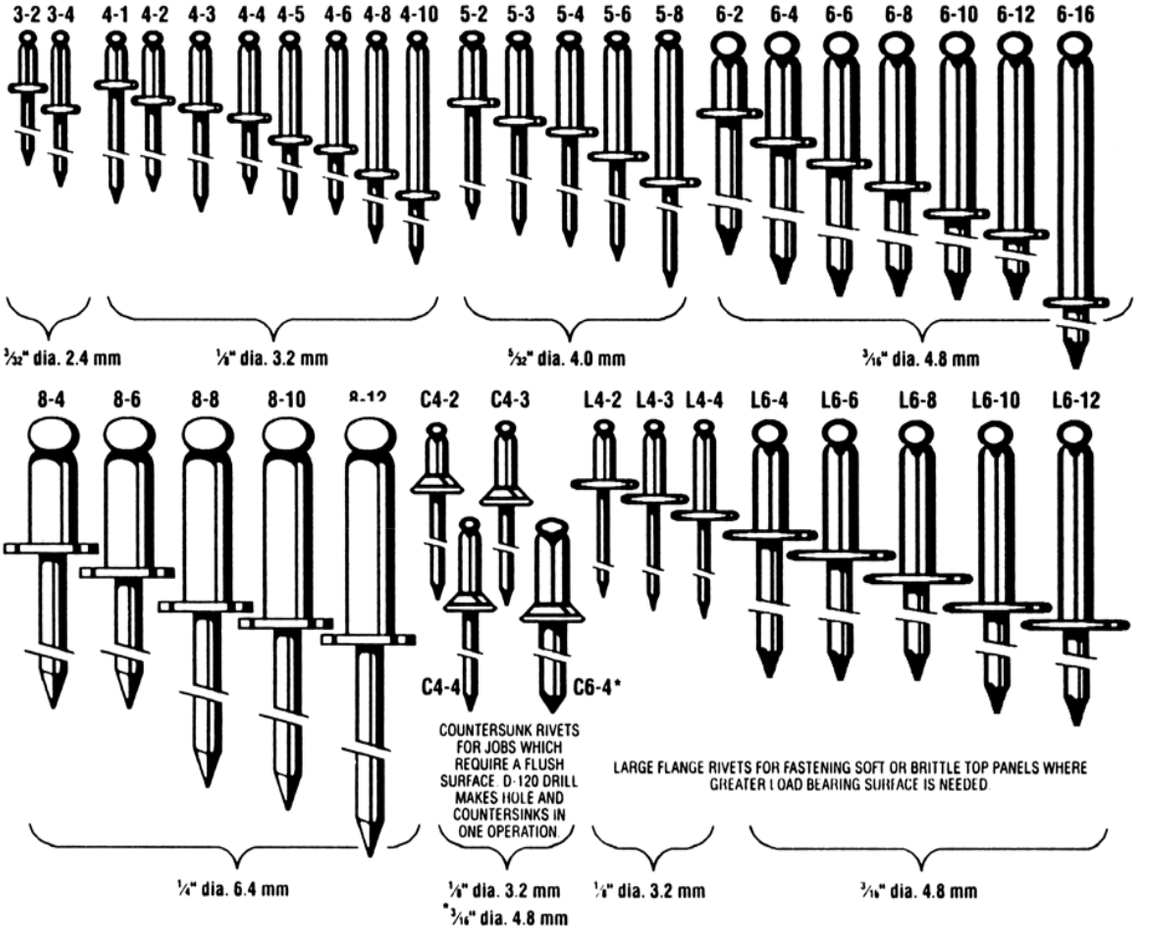

120° COUNTERSUNK
BLIND RIVETS are for applications where a flush appearance is required

CLOSED-END
BLIND RIVETS provide up to 45% greater shear strength over equivalent open end rivets, have 100% mandrel retention and are moisture resistant when used in the proper hole.
